

REMOTE WORK PROCEDURE ANALYSIS - SCREENSHOTS FROM AWS SERVICES

FIGURE 1

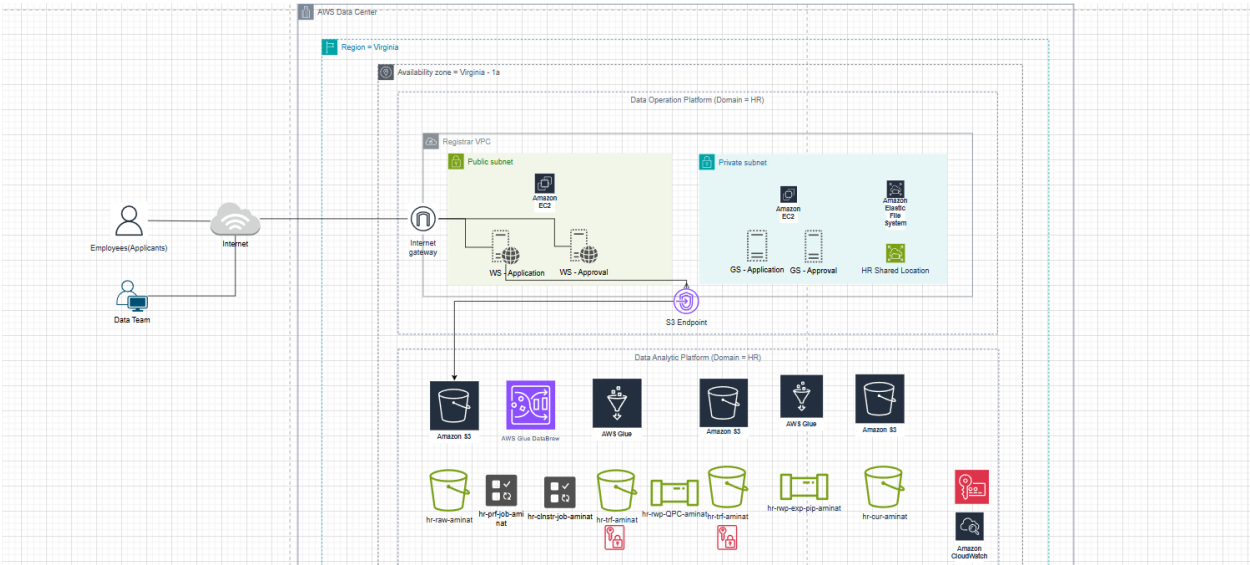

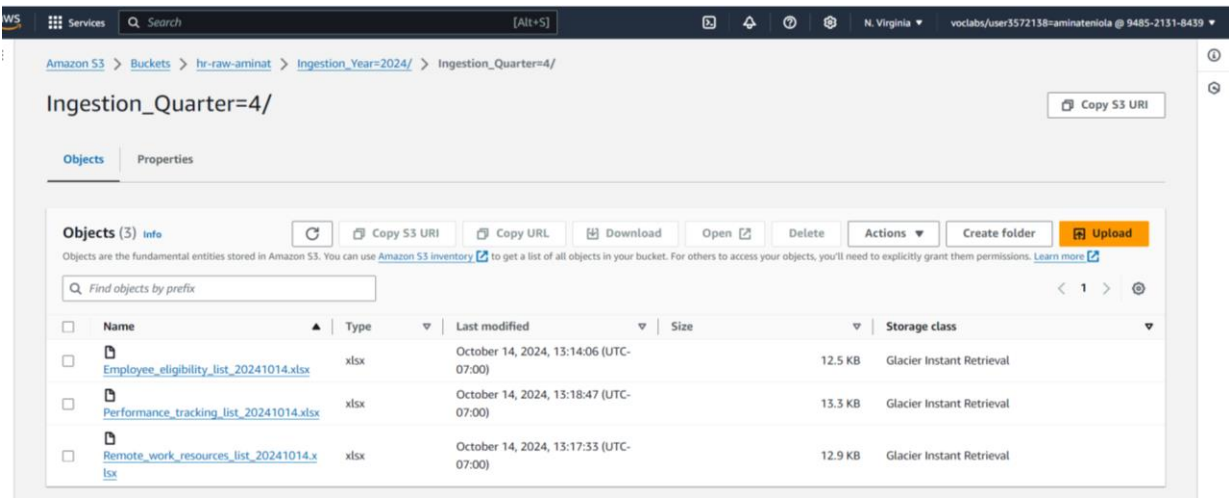

FIGURE 2 -

In this stage, the three datasets were cleaned using AWS Glue Databrew. It involved standardization of column naming and date formatting. These steps made the dataset accurate, consistent, and ready for further analysis. The use of AWS Glue Databrew for profiling and cleaning of the three datasets from

Remote work Procedure (namely) EMPLOYEES-ELIGIBILITY-LIST, PERFORMANCE-TRACKING-LIST(HR), AND REMOTE RESOURCES LIST.

FIGURE 3- s3

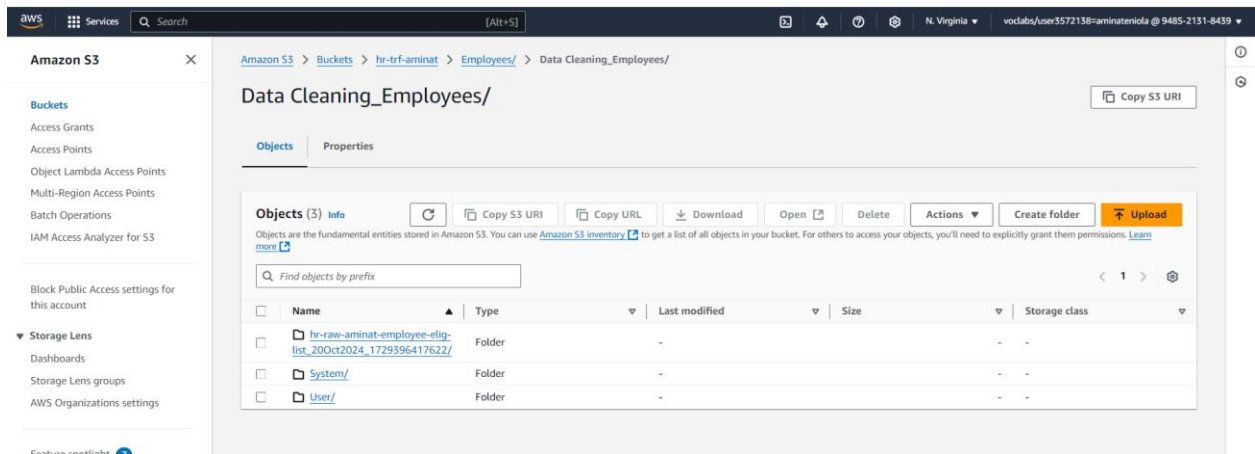

FIGURE 4

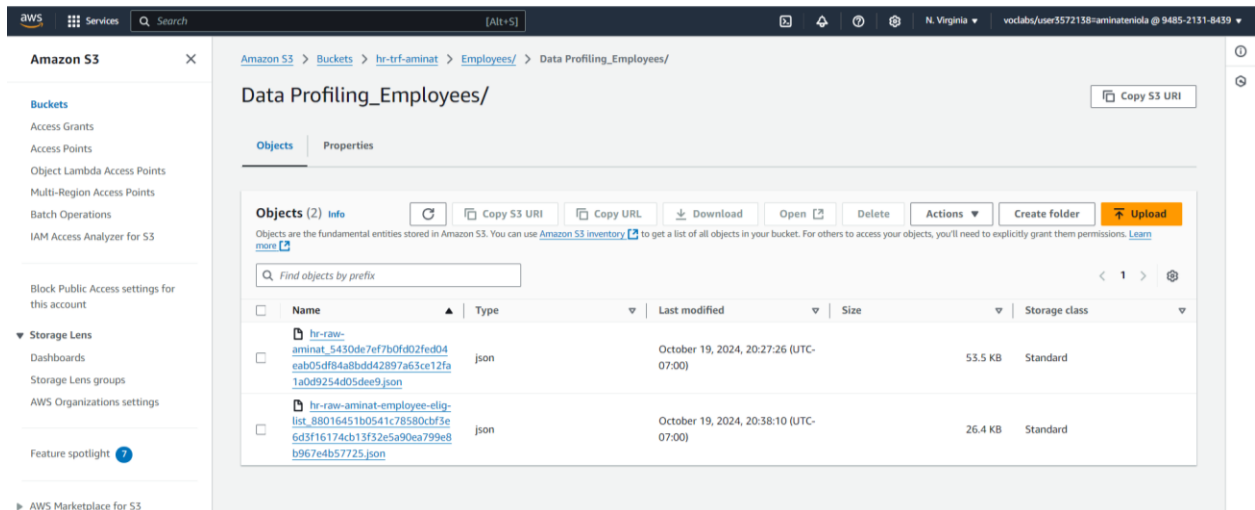

FIGURE 5

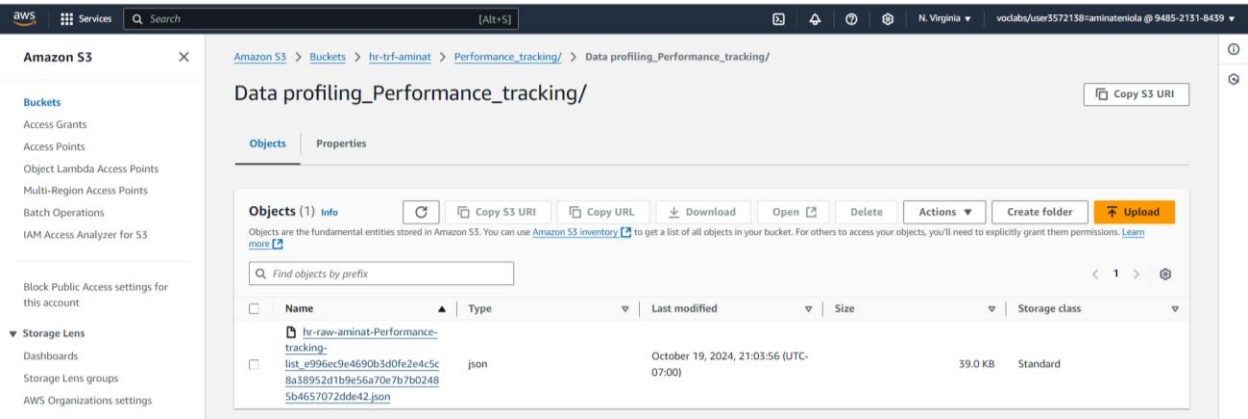

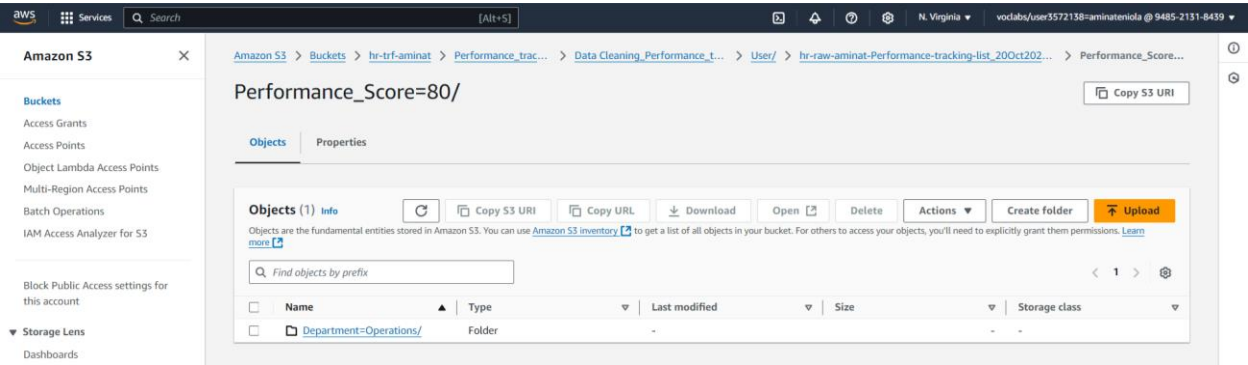

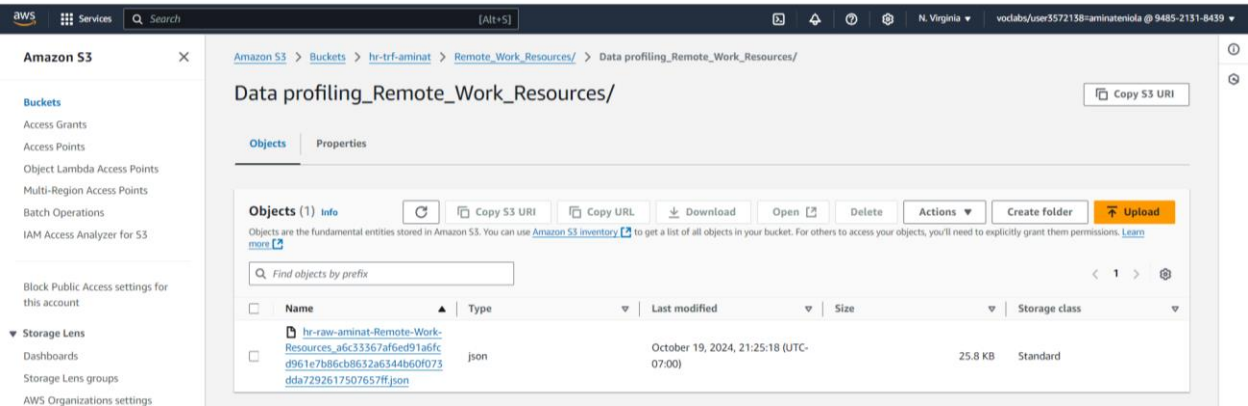

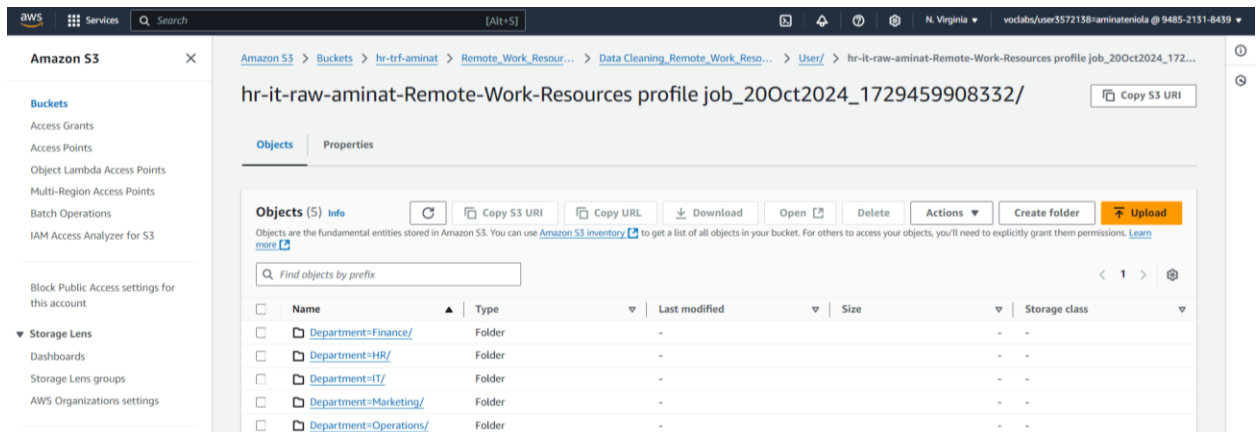

FIGURE 6

Business question (Dataset 1)

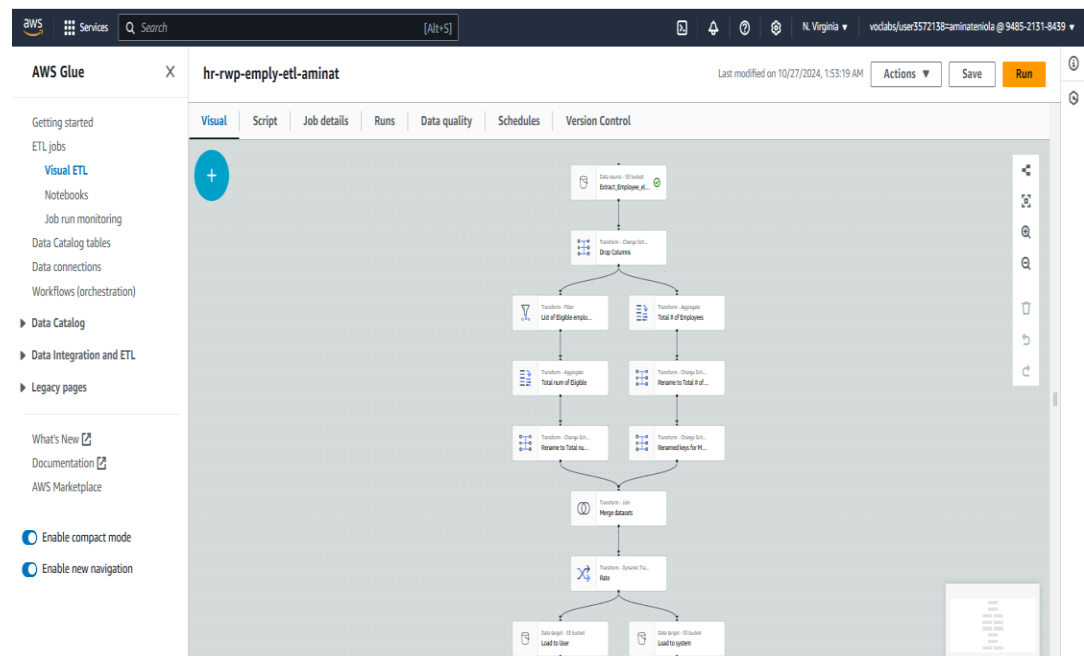

"How does remote work eligibility vary across employees and departments, and what implications does this have for resource allocation and policy adjustments?"

The question for **descriptive analysis** on the **Employee Eligibility List** :

1. What percentage of employees are eligible for remote work?

- Metric:** Count and percentage of eligible vs. ineligible employees. This provides a quick overview of the organization's stance on remote work eligibility and helps assess potential remote work policy impacts.

FIGURE 7

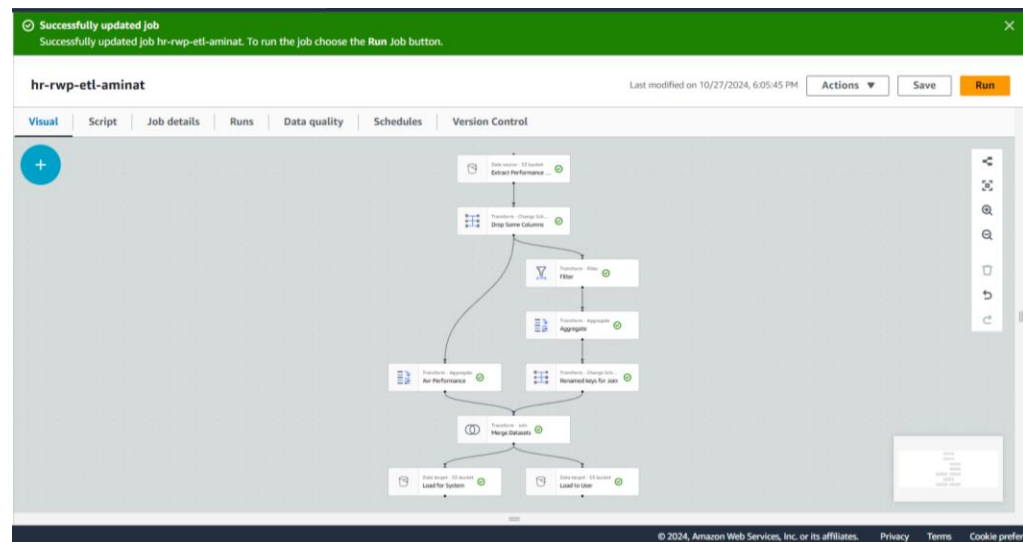

Business Question (Dataset 2):

"How is employee performance distributed across roles and departments, and what factors contribute to higher productivity levels in remote work?"

Data Question:

1. What is the average performance score across positions?
 - Metric: Average performance score by role, highlighting roles with higher or lower productivity. And the distribution of feedback ratings among employees

FIGURE 8

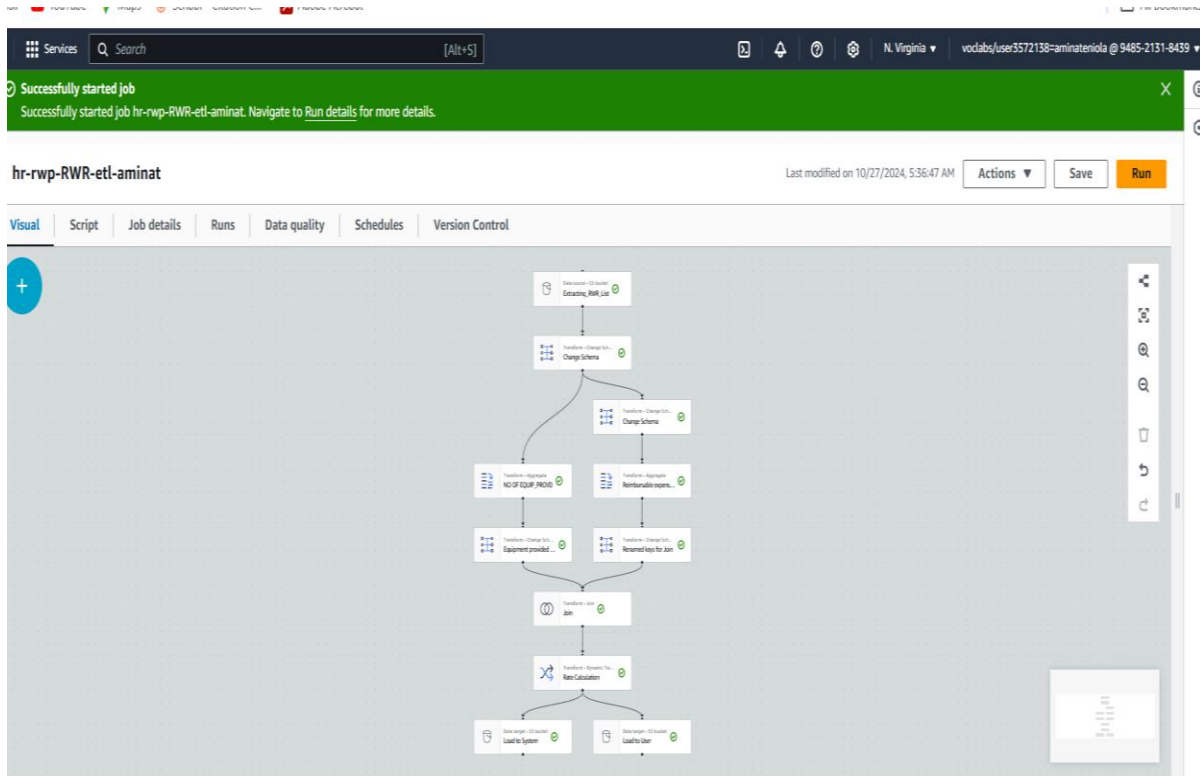

Business Question (Dataset 3):

"How effectively are remote work resources distributed across departments, and are they aligned with employee needs to support productivity?"

Data Question:

1. What percentage of employees have been provided with each type of equipment?
 - Metric: Count and percentage of employees with specific equipment (e.g., laptops, monitors) to determine resource allocation patterns.

FIGURE 9

Employees and Employees Eligibility Status – Diagnostic Analysis

The power of employee application clickstream sample data, captured through logins on a web virtual server (public subnet), to assess employee eligibility status comprehensively. This system tracks login frequencies, durations, and activities, providing real-time insights into employee engagement and compliance with remote work protocols. By mapping these data points against established eligibility criteria, the process not only identifies potential discrepancies but also pinpoints areas for proactive engagement and support, ensuring all employees meet the necessary standards for remote work eligibility.

FIGURE 10

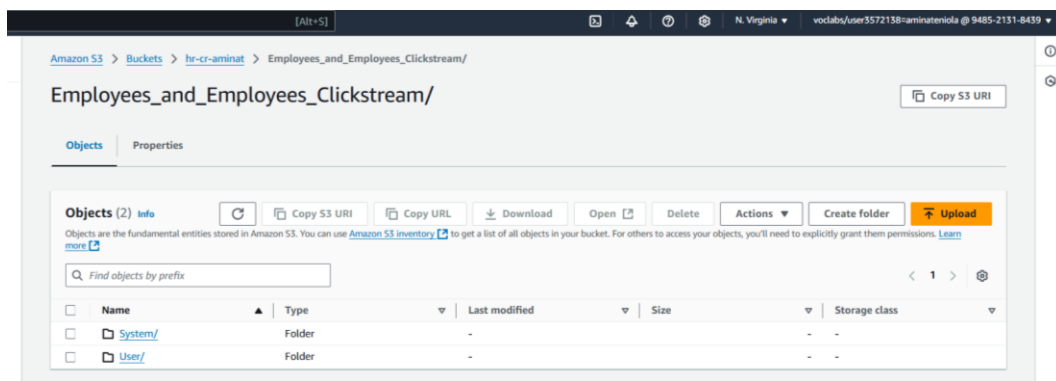

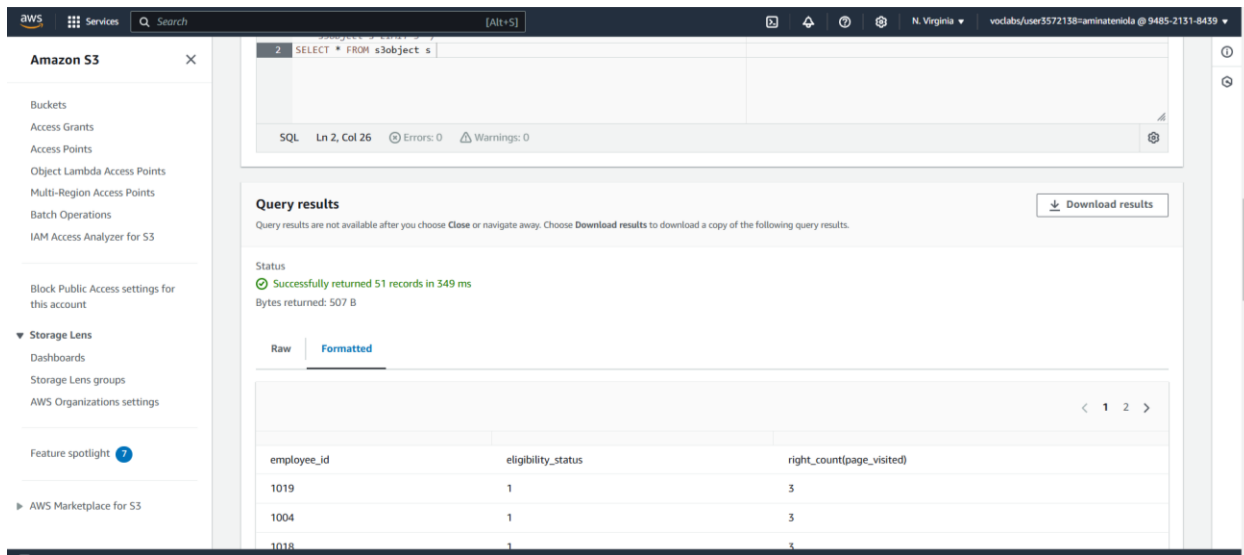

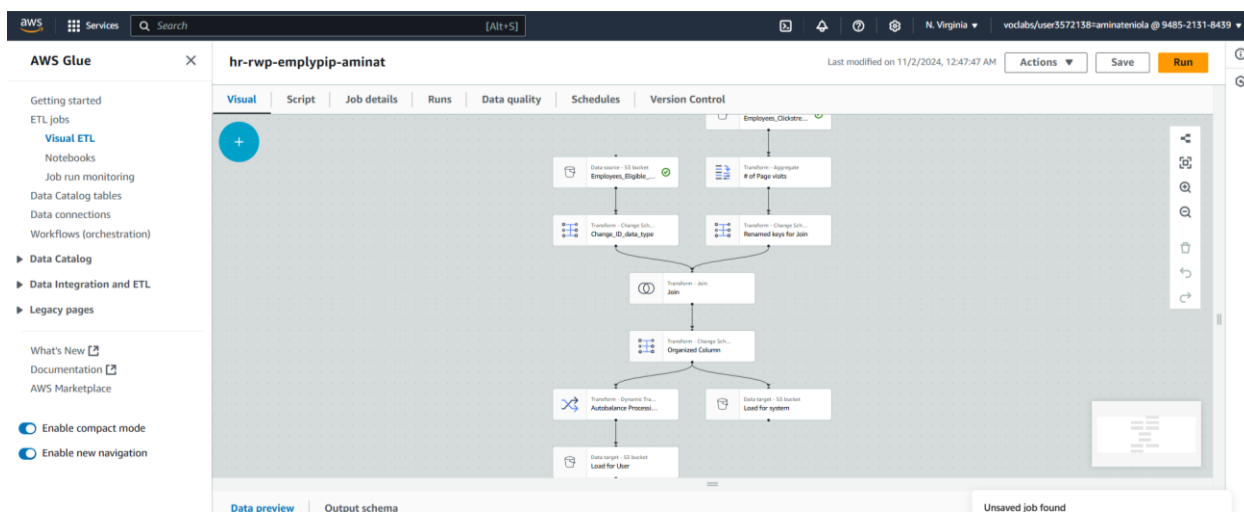

FIGURE 11

Performance tracking and monitoring analysis (Dataset 2)

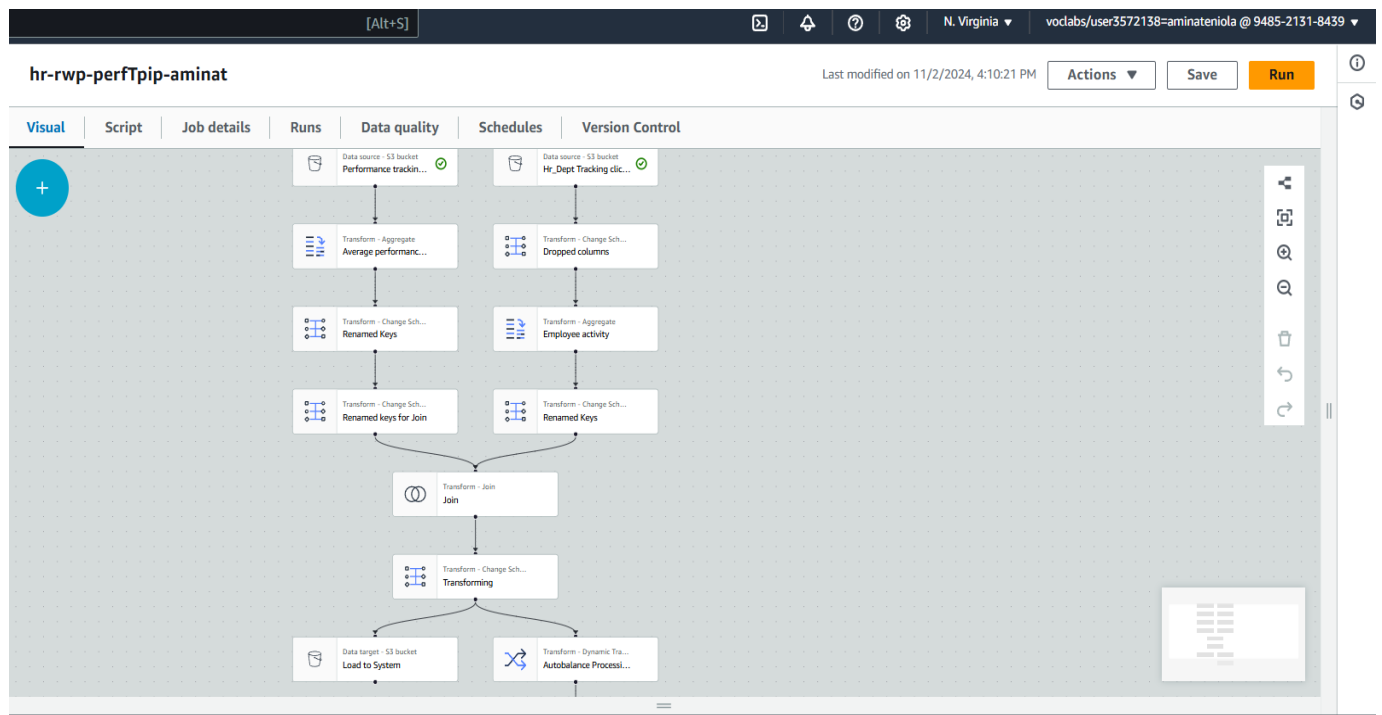

Leveraging AWS ETL and Glue, I designed a robust data processing pipeline focused on extracting and analyzing clickstream data from HR departmental logs on a secure private subnet. This setup meticulously correlates employees' remote login activities and work hours with their performance scores, ensuring that remote work does not compromise productivity.

FIGURE 12

The top screenshot shows the AWS Management Console interface for an Amazon S3 bucket named 'hr-cr-aminat'. The 'Query results' section displays the SQL query: `SELECT * FROM s3object s LIMIT 5`. The results show 11 records returned in 336 ms, with 436 B of data. The results are displayed in a table with columns: `employee_id`, `avg_performance_score`, `no_activity_per_id`, `avg(remote_work_hours)`, and `max_application_used`. The results are as follows:

employee_id	avg_performance_score	no_activity_per_id	avg(remote_work_hours)	max_application_used
1818	88.0	3	31.666666666666668	Microsoft Teams
1820	88.0	3	31.666666666666668	Zoom
1845	88.0	2	31.0	Zoom
1845	88.0	2	31.0	Zoom
1845	88.0	2	31.0	Zoom
1845	88.0	2	31.0	Zoom
1845	88.0	2	31.0	Zoom
1845	88.0	2	31.0	Zoom
1845	88.0	2	31.0	Zoom
1845	88.0	2	31.0	Zoom
1845	88.0	2	31.0	Zoom
1845	88.0	2	31.0	Zoom

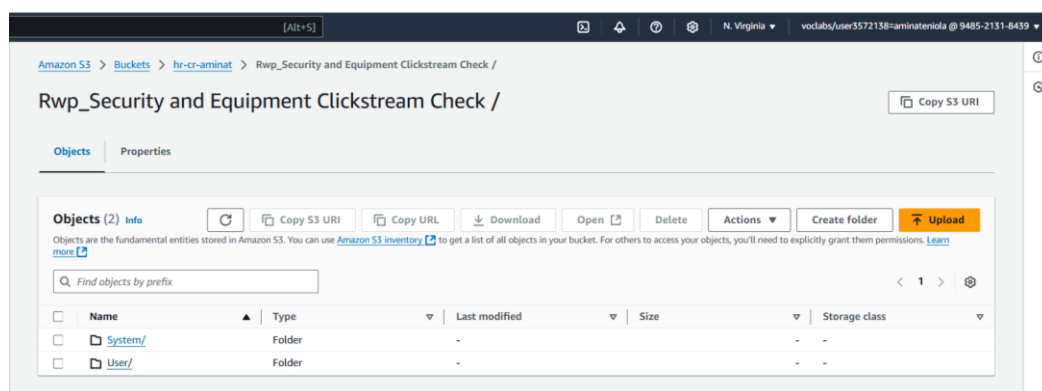

The bottom screenshot shows the 'Objects' tab of the same bucket, displaying a list of folders named 'position=Analyst/', 'position=Assistant/', 'position=Coordinator/', 'position=Executive/', and 'position=Manager/'.

Remote Work Resources_Security and Equipment Clickstream Check

Using AWS ETL and Glue, I built a secure data pipeline that merges remote work resource data with clickstream logs, offering insights into resource usage and security compliance. By joining HR resource lists with activity logs, this setup reveals how provided equipment, reimbursable expenses, and security measures align with employee activity patterns. This streamlined view enables validation of reimbursement claims, assessment of equipment usage, and monitoring of security standards, supporting informed decisions in managing remote work effectively.

AWS Glue > Crawlers

Crawlers
A crawler connects to a data store, progresses through a prioritized list of classifiers to determine the schema for your data, and then creates metadata tables in your data catalog.
